

TOHIN ROTARY BLOWER

**THE LARGEST ROTARY BLOWER SPECIALITY MANUFACTURER, TOHIN
WHICH IS PROUD OF HIS TECHNOLOGY AND PROVEN RESULTS IN JAPAN**

KIYOKU Factory

- For sanitary treatment (exposure to the air) in the septic tank and for purification of water
- For spraying for heavy oil and kerosene oil burners
- For breeding and propagating fish in water tanks for tropical fish and fish ponds
- For agitation in plating tanks and water treatment tanks
- For air curtain in water, etc.

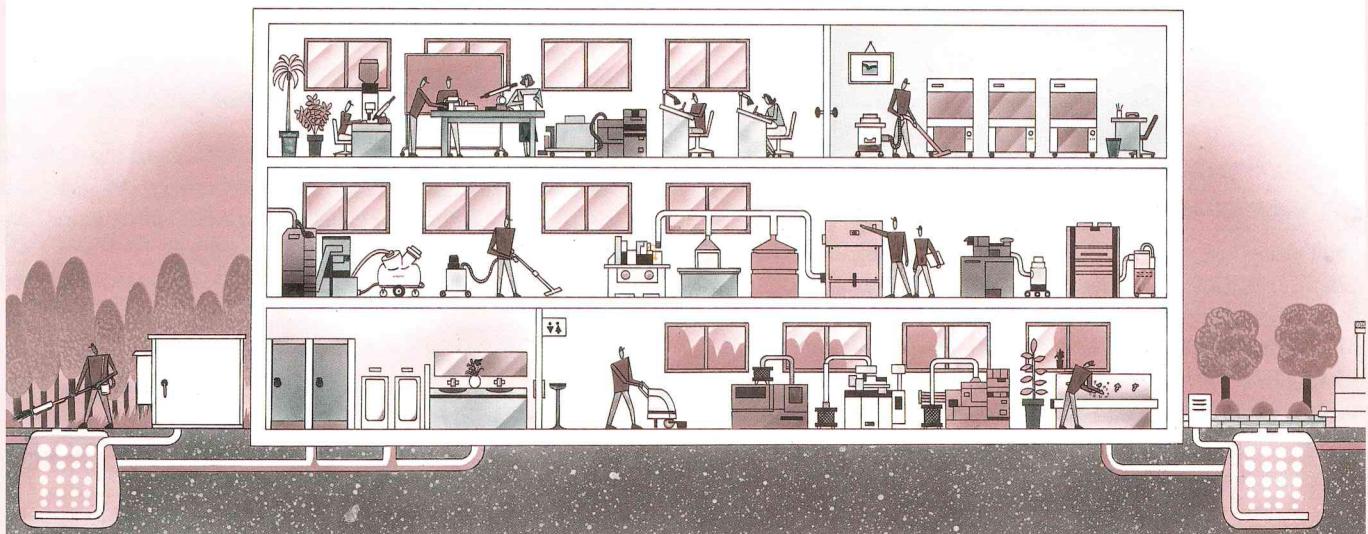

TOHIN is the largest speciality manufacturer of blowers having an ample experience and proven results with a long history of more than 40 years.

A large variety of TOHIN Rotary Blowers ranging from small to large types manufactured under strict quality control backed up by incessant technical development meet the requirements of all intended purposes and your full expectations.

Producing compressed air by rotary movement of the rotor, superior functionality and durability are the fruit of high technology of TOHIN including the realization of epoch-making quietness of operating sound.

TOHIN Rotary Blowers adopted not only for domestic use but also for industrial one are favourably commented for in a wide application field. The established production of more than 3 million units is a good proof of reliability.

(2)

Powerful Air Flowrate and yet Silent Operating Sound

Principles and construction of rotary blower

A blower will be used when a large quantity of air is required at normal pressure 0.1-0.5 kg/cm²G or so. A blower consists of the following main component units. Construction is simple, resulting in being little in occurrence of trouble.

- Motor
- Air filter
- Blower body
- Air chamber
- Base (and Oil tank)
- Oil dropping nozzle

A blower is so designed and constructed that air is sucked, compressed and discharged repeatedly while vanes protruding from the grooves of rotor are coming in and out by revolution of a rotor (rotating body) set eccentrically inside the cylinder diameter.

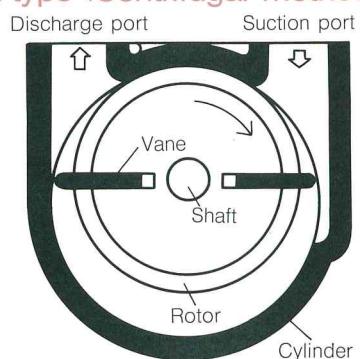

Friction heat is generated due to friction of iron and iron at rotating part and reciprocating part. Therefore, a minimum required quantity of circulating oil is dropped into the cylinder always while operating, by means of an oil dropping nozzle in order to make lubrication for the purpose of prevention of generation of heat and noise. Airtightness of blower is maintained by formation of an oil film among parts.

An automatic circulating equipment designed and manufactured by taking advantage of differential pressure of blower is adopted for circulation of oil.

Features of TOHIN Rotary Blowers

Compact, powerful air flowrate and yet silent operating sound

Compressed air is produced by revolving movement. Therefore, TOHIN Rotary Blowers display their powerful discharge capacity for their compactness. And yet, the operating sound is so small as eluding all attempts at mitigation by other competitors.

As the operating sound is quiet, no machine room is required for small capacity models. No large models require the soundproofing equipment in the machine room.

No vibration at the time of operation and simple installing work

In the case of small types, no vibration is generated at all. Mere installation of a rotary blower is enough to meet your requirements, not requiring tightening work with anchor bolts. No limitation is placed on installing place.

Securing of a fixed air flowrate even if a change takes place in the operating condition.

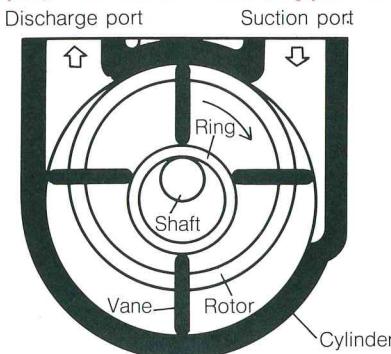

Take for instance, if a TOHIN Rotary Blower is used for sanitary treatment in the septic tank, almost no air flowrate is decreased even if load becomes large due to the change in the pressure inside tank.

Provided with an air chamber for carrying out air dispersion smoothly

End of discharge

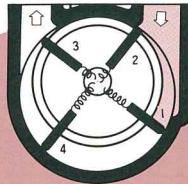

Compression stroke

Discharge stroke

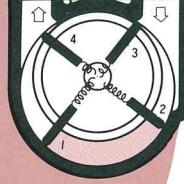

Suction stroke

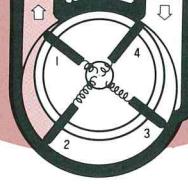

End of discharge

Compression stroke

Discharge stroke

All models are provided with an air chamber, resulting in being free from air pulsation and air dispersed smoothly.

High superiority for keeping always high performance

Highly durable materials are adopted for all operating parts and outside, including cylinders. TOHIN Rotary Blowers are designed and manufactured very robustly as almost free from trouble and deterioration of performance after a long use.

Unique mechanism — oil dropping equipment

No oil choked, no oil scatter, and very little oil decrease by the unique mechanism — oil dropping equipment

Check value built in (SD, FD, and HC type)

Provided with a check valve which prevents the back flow from the tank.

Air releasing valve built in (SD, FD, and HC type)

Provided with an air releasing valve which prevents the burning damage of a motor at the time of overloading that is clogging of holes due to entry of foreign matter at the time of piping as well as mesh clogging trouble of air dispersion pipe and which serves for an alarm whistle.

S type

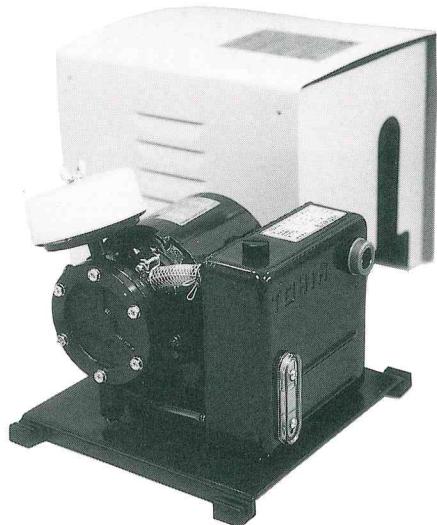

Rotary Blower

S-40

S-60

S-80

A motor direct coupling system has been adopted.
As no rotary part is exposed, the operating sound
is quiet, assuring safety.
